

Task: PySpark CI with GitHub Actions

Objective

Implement a PySpark data-processing function and configure GitHub Actions to automatically test it whenever a Pull Request is created or updated.

```
spark-project/  
├── .github/  
│   └── workflows/  
│       └── ci.yml  
├── pyspark_job.py  
├── test_pyspark_job.py  
└── requirements.txt
```

Write inside **requirements.txt** file the following:

```
pyspark==3.5.6  
pytest==8.4.2
```

1. Function to Implement

In `pyspark_job.py`, implement:

```
def clean_data(df):  
    pass
```

2. Requirements

The `clean_data` function should:

- Remove rows where amount ≤ 0 .
- Remove rows where name is NULL.
- Add a column `amount_with_tax`.
- Calculate `amount_with_tax` as `amount * 1.20`.

3. Testing

Create PySpark unit tests using `pytest`.

The tests should verify:

- Valid records are kept.
- Records with amount ≤ 0 are removed.
- Records with NULL names are removed.
- `amount_with_tax` is calculated correctly.
